

Your mattress fabric is fireproof

Flame Block mattress fabric, which passes BS EN 597-1 and BS EN 597-2 standards, is tested for its reliability against fire risk by resisting when exposed to flame. Flame Block +, on the other hand, is designed with increased protection and is developed to significantly reduce the risk of ignition.

Air Permeability

The 1600s to today

The risk of fire is more likely in situations when flammable chemicals or combustible materials are being used, but even in offices and other lower-risk environments, the risk of fire is always prevalent. So we need to be wise and responsible all the time. One of the first flame retardant applications for the textile industry was made to reduce the fire risk of the curtains of the Paris Theater in the 1600s

Protective Barrier

Flame Block and Flame Block + mattress fabrics, which are specially developed by AYDIN, help prevent fires. It acts as a protective barrier on the mattress.

Hard flammability finishing is applied to mattress fabric with a large surface area and the potential to burn, for protection against ignition. They delay the burning of the fabric and thus prevent the acceleration of the fire. This saves time for the first action to fire, first aid, and escape. It also reduces the energy and toxic gases emitted during the fire.
